A real-time strategy (RTS) game developed by Mistwalker and published by Square Enix for the PlayStation 2 (PS2) video game console in Japan in December 2000, and in North America and Europe in 2001. The gameplay is similar to the earlier Final Fantasy Tactics and Final Fantasy Tactics Advance games, featuring real-time tactical battles, but without any turn-based elements. The game follows the adventures of powerful a group of knights that is led by their commander, the Prince of Nobilis, and a young mage named Ala Mhigan. At the game's start, the Prince's party, on a quest to rescue the wizard, Ala Mhigan, from an evil sorcerer named Mogle, the King of the Dark Territory, they are attacked by an evil empire led by Baron Abyss. In the game, the player's combat party controls a range of different troops from their own units to the other kingdom's. As they progress through the game they collect an army of capable fighters, mages and weapons of war. In addition to the battles, the player also manages a diplomatic relationship between the main characters and other kingdoms. The game includes a number of minigames that are used to evolve and equip the characters. A novel method for in vitro quantitation of drug synergy and antagonism. A novel method is described for the in vitro quantitation of drug synergy and antagonism. This method is a modification of the Bliss independence model for quantitating the effects of two drugs. The model was originally developed to study the effect of two drugs acting independently. However, the model can be used to quantify the effects of two drugs when they are acting either synergistically or antagonistically. The "neutral" dose was chosen so that a number of infinitesimal concentrations (i.e., sufficiently low doses) are obtained with the same molar ratios (i.e., without using any measure of drug concentration). The experimental results agree well with the calculated values from the model. The antagonism parameter (i.e., alpha) has little dependence on the level of the antagonistic drug. The synergism parameter (i.e., beta) is related to the concentration of the synergistic drug. A computer program was written in VBA BASIC FOR WINDOWS 3.1 (Microsoft Corp., Redmond, WA) to process the experimental data using this model. The program is available for use by anyone who wishes to obtain similar data.You are here MapBox MapBox is the world's most popular location-based technology. Thousands of developers have built amazing location-based features into their mobile apps and web apps. With MapBox, businesses and consumers are able to easily add location services to their websites and apps, and interact with the maps like never before. We are bringing the best location-based features to developers who want to create cutting edge products, and business and marketing teams who want to deliver exciting new products and experiences. We are partnering with world-class developers and creating reliable, powerful services that will push the envelope of mapping. Now, you can use MapBox just like Google Maps to provide location-based services on the web. Add OpenStreetMap and overlays into existing maps or create your own custom map mash-ups that work anywhere you are. Try the Map

Borrelia burgdorferi sensu lato is the causative agent of Lyme disease in Europe and North America. The current laboratory method for its detection is culture-based and cumbersome. Molecular amplification tests are typically more sensitive, but not specific enough to differentiate between wild-type and drug-resistant strains. In this study, we evaluated the use of a novel, highly sensitive loop-mediated isothermal amplification (LAMP) assay that can specifically distinguish wild-type B. burgdorferi sensu lato from B. garinii and B. afzelii clinical isolates and discriminate between sensitive and resistant strains. The LAMP assay can detect as few as 3 and 10 B. burgdorferi sensu lato cells per reaction, compared with 10-100 cells for the PCR assay. The overall sensitivity and specificity of the LAMP assay were significantly better than those of the PCR assay, allowing for the detection of 28 out of 33 B. burgdorferi sensu lato isolates (85.3%) and none of the clinical samples containing other organisms. This assay is considerably more sensitive than the current methods for the detection of B. burgdorferi sensu lato and can be used for rapid and sensitive detection of the organism in clinical samples.#!/usr/bin/env node var lib = require('../lib'); var cli = require('ethereumjs-wallet/commands/cli'); var cmd = new cli.Command(lib, cli); module.exports = cmd; cmd.command('openreg', 'opens a registration record', function(this_arg, options, done) { options.regtype = options.argv[2]; var out = []; for (var i = 0; i
